Cologuard Plus data

Important Information about the Cologuard products

Indications for Use

The Cologuard® and Cologuard Plus™ tests are intended for the qualitative detection of colorectal neoplasia associated DNA markers and for the presence of occult hemoglobin in human stool. A positive result may indicate the presence of colorectal cancer (CRC) or advanced adenoma (AA)/advanced precancerous lesions (APL) and should be followed by a colonoscopy. The Cologuard test and Cologuard Plus test are indicated to screen adults of either sex, 45 years or older, who are at average risk for CRC. These tests are not a replacement for diagnostic colonoscopy or surveillance colonoscopy in high-risk individuals.

Contraindications

The Cologuard products are not for high-risk individuals, including patients who have the following:

- a personal history of colorectal cancer and adenomas
- a positive result from another colorectal cancer screening method within a test recommended timeframe
- have been diagnosed with a condition associated with high risk for colorectal cancer such as IBD, chronic ulcerative colitis, Crohn's disease
- have a family history of colorectal cancer, or certain hereditary syndromes

Warnings and Precautions

All positive results should be referred to colonoscopy.

The Cologuard products may produce false positive and false negative results. A false positive result occurs when a result is positive, even though a colonoscopy will not find CRC or APL. A false negative result occurs when a result is negative, even when a colonoscopy identifies APL or CRC.

A negative result does not guarantee the absence of colorectal cancer or advanced adenoma. Following a negative result, patients should continue participating in a screening program at an interval and with a method appropriate for the individual patient. Performance when used for repeat testing has not been established.

Refer to the Cologuard test Clinician Brochure (cologuardhcp.com/cologuard-brochure) or the Cologuard Plus test Clinician Brochure (cologuardhcp.com/cologuard-plus-brochure) for additional information about the benefits and risks of using each version of the Cologuard product for CRC screening.

Rx only.

*Cologuard Plus CRC sensitivity was demonstrated in a subset of 18,911 average-risk patients aged 45 to 84 years from a prospective, multicenter study. Screening colonoscopy was the reference method. Colonoscopy CRC sensitivity is based on a USPSTF review of 4 separate studies (n=4821).^{2,3}

†Based on a simulated CRC-SPIN model that compared screening with a colonoscopy at a 10-year interval and the Cologuard Plus test at a 3-year interval and assumed perfect adherence in patients aged 45-85 years.⁵

‡Exact Sciences estimate based on historical patient billing as of November 2024. Exceptions for coverage may apply, only your patients' insurers can confirm how the Cologuard test would be covered.⁶

CRC=colorectal cancer; CRC-SPIN=Colorectal Cancer Simulated Population model for Incidence and Natural history; USPSTF=United States Preventive Services Task Force.
